

Product Code . SEL-FMM-11046

Metacentric Height Apparatus

Description

Metacentric Height Apparatus

The angle of tilt is measured by displacement of pointer & from then the metacentric height of ship can be studied. Displacement of weight is measured with a scale. A pointer is attached at the centre of ship. When the weight is slide the ship tilts.

The ship model is provided with a horizontal guide bar over which a small weight can be slided. The unit consists of a small tank. Water is poured in it; so that a small ship model can float over it.

We are leading manufacturers, suppliers of Metacentric Height Apparatus for Fluid Mechanics Models. Contact us to get high quality Metacentric Height Apparatus for Fluid Mechanics Models for schools, colleges, universities, research labs, laboratories and various industries.
